Personal Task Manager (Lifecycle Justification)

Introduction

For our project, we decided to use the Agile model.

The reason behind this choice is simply that our project is not something fixed from the beginning. While working on it, we kept thinking of improvements and small changes, so we needed a model that allows flexibility.

Why Agile Works for Our Project

1. Requirements are not fixed

At the start, we only planned basic features like creating and managing tasks.

But as we progressed, we realized that we needed to improve things like:

- The layout of the board
- How tasks move between columns
- Making the system easier to use

Agile helped us deal with these changes without any problem, instead of being stuck with the first plan.

2. Working step by step (Sprints)

Instead of building the whole system at once, we divided the work into small parts (sprints).

For example:

- In the first sprint, we focused on creating tasks
- In the second sprint, we added editing and deleting
- In the third sprint, we improved the design and fixed issues
- This made the work easier and more organized.

3. Learning and improving continuously

After each sprint, we looked at what we built and asked:

- Is this easy to use?
- Can it be better?

This made the project improve gradually instead of waiting until the end.

4. Delivering something usable early

One important thing in Agile is that you don’t wait until everything is done.

Even early in the project, we already had a working system where tasks can be created.

Then we kept improving it step by step.

5. Better teamwork

Agile also helped us work better as a team.

We were communicating regularly, dividing tasks, and helping each other when something was unclear.

This made the work smoother and reduced problems.

Why we didn’t choose other models

- We didn’t choose Waterfall because it requires everything to be planned from the beginning, which didn’t match our situation.
- Spiral was not needed because our project is not high risk.
- Incremental is similar, but Agile gave us more flexibility and continuous feedback.

Conclusion

Agile was the best choice for our project because it allowed us to:

- Change things when needed
- Improve the system step by step
- Work better as a team
- It helped us build a simple but useful system in a practical way.
